"Study of the Microstructure of KCl Alkali-Halide Single Crystals by Lang's Method"

Kiev, Metallofizika, No 31, 1970, pp 132-139

Translation: It is shown that x-ray diffraction topography as applied to KCl alkali-halide single crystals without impurity and alloyed barium and lead cations can give important information on the dislocation structure in the volume of a specimen. The boundaries of low-angle blocks oriented toward the observation surface in various ways and dislocation networks embedded in the volume of and within the blocks were detected by the Lang method. Individual cases of a good contrast on individual dislocations, the effect of the thickness of a crystal on the image contrast of the imperfections during a change of μt in the interval 0.35-2.7, and a change in contrast in the points of intersection of orthogonal slip lines were revealed. The characteristics of the microstructure disclosed by x-ray diffraction topography were compared with the data obtained by means of etching, by the polarization optical method, and during observation in an ultramicroscope.

Gigiyena (Hygiene), Moscow, "Meditina," 1970, 384 pp

Translation: Annotation: This textbook has been compiled for students of pharmaceutical institutes and pharmaceutical faculties of medical institutes in accordance with the hygiene teaching program. It contains materials corresponding to the nature of their future work. Such materials concern problems of hygiene in pharmacies, labor hygiene in galenical and chemicopharmaceutical enterprises, foundations of epidemiology and organization of antiepidemic measures, and sanitary education.

The indicated subjects are completely lacking in hygiene textbooks issued for students of therapeutic, sanitary, and other faculties of medical institutes.

Some facets of general hygiene are elucidated also in this textbook without which it is impossible for students to learn certain hygienic problems which are specific for them as future specialist pharmacists.

"Colorimetric Method for the Determination of Microquantities of DDVP in
Milk and Water"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 11, No 8 (118), 1973, pp 47-49

Abstract: A colorimetric method has been developed for the determination of DDVP (0,0-dimethyl 0,2,2-dichlorovinyl phosphate) in milk and water, based on the extraction of the insecticide from water by methylene chloride and from milk by petroleum ether, after treatment with acetone, followed by spectrophotometric determination at $\lambda 487 \text{ m}\mu$ of the dichloroacetaldehyde condensation product obtained as a result of alkaline hydrolysis with resorcinol. The sensitivity of the method is 0.1 mg/l of milk and 0.04 mg/l of water.

"Determination of Residual Quantities of Chloro- and Organophosphorus Pesticides in Food Products, in Soil, and in Water"

Moscow, Zhurnal Vsesoyuznogo Khimicheskogo Obshchestva imeni D. I. Mendeleev, Vol 18, No 5, 1973, pp 562-570

Abstract: A review with 209 references devoted to the analytical methods for residual quantities of chloro- and phosphorus organic pesticides in food, soil and water. The review covers methods for extraction of these pesticides from specimens being analyzed, purification methods for these extracts, identification of individual substances and finally of their determination.

in Plants"

Tr. 2-go Vses. soveshch. po issled. ostatkov pestitsidov i profilakt. zagryaz-
neniya imi produktov pitaniya, kormov i vnesh. sredy (Works of the Second All-
Union Conference on the Investigation of Pesticide Residues and Preventive
Contamination of Food Products, Feeds and Environment), Tallin, 1971, pp
295-299 (from RZh-Khimika, No 12, Jun 72, Abstract No 12N446)

Translation: Phosalone (I) is extracted from fruits with acetone; it is re-
extracted with CHCl_3 , the extract is evaporated and I is sublimed at $85-90^\circ$
0.4-0.5 for 30 minutes. The sublimed I is dissolved in acetone, hydrolyzed
by NaOH to 5-Cl-2-NH₂C₆H₃OH (II) and the coupling product of diazotized II with
resorcinol is analyzed spectrophotometrically at 490 nm. The sensitivity of
the method is 0.1 mg/kg; the degree of detection of I is $90.1 \pm 12.4\%$.

"Chromatophotometric Method of Determining Residual Quantities of Phosalon in Fruit and Vegetable Products"

Moscow, Khimiya v Sel'skom Khozyaystve, Vol 8, No 9 (83), Sep 70,
pp 40-42

Abstract: Phosalon is a new organophosphorus insecticide of comparatively low toxicity for warm-blooded animals. This chemical is based on 0,0-diethyl-S-(6-chlorobenzoxazolinyl-3-methyl)-dithiophosphate, and is a promising substitute for DDT in combatting aphids, the lesser apple worm, grape pests, mites and other insects. The authors of this article describe a chromatophotometric method which they have developed for determining phosalon in apples, pears and grapes. The method is based on acetone extraction of phosalon residues with subsequent redistribution from the acetone:water system (1:2) into chloroform, chromatographic separation, and identification on a thin layer of silica gel. After acetone elution of the 1/2

"Study of the Fine Structure of Specimens of Nickel Powder Produced by Impact Loading"

Metallovedeniye i Prochnost' Materialov, T. 3 [Metal Science and the Strength of Materials, Vol 3 -- Collection of Works], Volgograd, 1971, pp 309-314, (Translated from Referativnyy Zhurnal, Metallurgiya, No 5, 1972, Abstract No 5 G471 by S. Krivonosova).

Translation: An x-ray study is presented of specimens produced by impact loading. The level of strain hardening of various zones decreases upon transition from the surface to the center of the specimen. With impact loading, the temperature of the central portion of the specimen is increased significantly, leading to melting of the powder and full relief of strain hardening (increasing temperature resulting from intensity of plastic deformation of the powder).

"Transplantation of Allogeneous Bone Marrow to Thymectomized Irradiated Monkeys"

Moscow, Problemy Gematologii i Perelivaniya Krovi, Vol 16, No 3, Mar 71, pp 45-53

Abstract: Since transplantation of allogeneous bone marrow to irradiated animals for the purpose of alleviating radiation sickness gives rise to a secondary disease due to differentiation of the transplanted tissue into lymphocytes which enter into an immunological reaction with the host, a study was performed in which thymectomized monkeys were irradiated with 800-1,000 r and then given allogeneous bone marrow transplants. The thymectomy did not prevent the development of the secondary disease, but made it

"Viscosity of Optical Glasses"

Leningrad, Zhurnal Prikladnoy Khimii, Vol 43, No 6, Jun 70, pp 1218-1225

Abstract: The viscosity η of 120 grades of glass ($\eta = 10^2 - 10^{13}$ poises) in relation to the temperature was determined. The results are listed in tables showing values of $\lg \eta$ for various temperatures t . The values included in the tables were obtained in part by interpolation and extrapolation of experimental values to cover the complete $\eta = 10^1 - 10^{16}$ poises range ($t = 312-2010^\circ$). Determinations at $10^4 - 10^{13}$ poises were carried out by the method of pressing in described earlier, those at $10^1 - 10^4$ poises by means of GOI automatic rotational viscosimeters. Measurements of η carried out by the first method on glass No 710 of the USA National Bureau of Standards led to results which coincided with those reported by A. Napolitano and E. G. Hawkins, J. Res. Natl. Bur. Stand., A. Phys. & Ch., 68A, 439, 1964. The rotational viscosimeters were calibrated at $10^2 - 10^4$ poises on the basis of values reported for glass No 710. Data obtained for B_2O_3 by means of these viscosimeters agreed with those reported in the literature. A glass with the composition SiO_2 69.60, B_2O_3 11.09, Al_2O_3 2.00, As_2O_3 0.10, BaO 0.65, CaO 1.37,

"Effect of 'Immunologic Sympathectomy' on the Cardiac and Respiratory Rates in High-Altitude Hypoxia"

Moscow, Kardiologiya, No 12, 1971, pp 98-99

Abstract: "Immunologic sympathectomy" was performed in 1- to 5-day-old rats by injecting them with antibody to the nerve growth factor. Histologic examination of the sympathetic trunk a month later revealed a sharp decrease in the number of cells and concomitant disappearance of norepinephrine from the myocardium but increased concentration of epinephrine. The spinal ganglia, however, were little affected by the immune serum. The resistance of the "sympathectomized" animals to hypoxia induced by gradual "elevation" in a pressure chamber to "altitudes" of 1000 to 11,000 m (as determined from the EKG, pneumogram, and rectal temperature) was virtually the same as the control. This finding can be reconciled with published references to lowered resistance of sympathectomized animals to acute hypoxia by assuming that the sympathetic nervous

1/2

USSR

NOVIKOVA, N. A., et al., Kardiologiya, No 12, 1971, pp 98-99

system is mobilized by sudden acute hypoxia but not when there is a possibility of slow, gradual adaptation to a deficiency of oxygen.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. WISTAR RATS WERE TRAINED FOR 40 DAYS IN A BAROCHAMBER, 6 HOURS DAILY AT AN "ALTITUDE" OF SEVEN THOUSAND METERS. SUCH TRAINING LED TO ACTIVATION OF THE SYNTHESIS OF NUCLEIC ACIDS AND PROTEIN IN THE MYOCARDIUM OF THE LEFT, AND, PARTICULARLY, OF THE RIGHT CARDIAC VENTRICLE (WHICH SERVED AS THE BASIS OF HYPERSTROPHY), AND TO INCREASE OF THE MAXIMAL POWER OF CONTRACTION OF THE VENTRICLES (OF THE LEFT, BY 18 PER CENT, AND OF THE RIGHT, BY 33 PER CENT). THIS TRAINING WAS CARRIED OUT FOR THE PURPOSE OF PREVENTION OF ACUTE CARDIAC INSUFFICIENCY PRODUCED BY OVERLOADING IN CORACTATION OF AORTA. PRELIMINARY TRAINING TO HIGH ALTITUDE HYPOXIA PROVED TO PREVENT OR TO REDUCE DISTURBANCES OF METABOLISM AND MYOCARDIAL FUNCTION WHICH USUALLY FOLLOWED INDUCTION OF AN EXPERIMENTAL DEFECT, AND CONSTITUTED THE BASIS OF CARDIAC INCOMPETENCE. "Dynamics of Myocardial Contractility During and After Adaptation to High-Altitude
Hypoxia"

Moscow, Byulleten' Eksperimental'noy Biologii i Mediitsiny, Vol 70, No 11, Nov 70,
pp 30-32

Abstract: Rats were conditioned to moderate hypoxia (6000 m) in a pressure chamber for 8 weeks. The conditioning enlarged the heart and increased its functional capabilities as measured by the maximum force of myocardial contraction and the index of contractility. A similar period of conditioning at a higher simulated altitude (7300 m) resulted in even greater hypertrophy and a corresponding increase in the maximum force of myocardial contraction. Six weeks after the conclusion of the training period, the ventricular hypertrophy returned to normal and contractility was the same as in the controls.

liminary Conditioning of Animals to High-Altitude Hypoxia"

Moscow, Patologicheskaya Fiziologiya i Eksperimental'naya Terapiya,
No 2, 1970, pp 49-54

Abstract: A total of forty days of conditioning of Wistar rats to hypoxia (6 hours daily at a simulated altitude of 7000 m) intensified the synthesis of nuclei acids and protein in the myocardium of the left and right ventricles (especially the latter), and increased the maximum force of ventricular contractions. Cardiac insufficiency induced by coarctation of the aorta resulted in marked edema of the subcutaneous fatty tissue of the neck and chest in untrained rats, but did not have this effect in trained animals. Cardiac insufficiency also produced metabolic disturbances and impaired myocardial contractility in untrained animals. In the 1/2

ACTIVITY OF ENZYMES OF ENERGETIC METABOLISM IN THE NORMAL HUMAN SKIN

N. F. Novikova

Summary

Histochemical study of oxidative-reductive enzymes in the normal human skin (10 observations) indicated that in the epidermis processes of glycolysis were much more prevalent than respiratory processes. The greatest activity in the epidermis and structures of derma was found in NAD- and NADP-diaphorases reflecting the state of activity of dehydrogenases associated with NAD and NADP. Distribution of the enzymes under study in the skin was not uniform which reflected different intensity of biochemical processes in different cells depending upon their functional state.

Kiga, Khimiya Geterotsiklicheskikh Soyedineniy, No 7, 1973, pp 942-944

Abstract: Experiments were conducted on the cyclization of 2-(β -aminoisobutyl)indole and 1-methyl-2-(β -aminoisobutyl)indole with several alicyclic and heterocyclic ketones in a mixture of absolute ethanol and benzene containing catalytic amounts of HCl. These reactions yielded imines or spirans of the 1,2,3,4-tetrahydro- γ -phenolic series.

"A Method of Filmless Information Recording From Wire Spark Chambers in a Strong Magnetic Field"

Moscow, Pribory i Tekhnika Eksperimenta, No 5, 1973, pp 55-56

Abstract: The basic idea of this method is the recording of ultrasonic oscillations arising from the interaction of a current induced in a sonic conductor with an external magnetic field. The present article explores the use of the electrodynamic method, with an intense magnetic field, in the filmless information recording system, based on this idea, involving wire spark chambers with ferrite and magnetostriction information recording. The exploration was first conducted with models and then on a mock-up of the wire spark chamber measuring 1200X650 mm², filled with a Ne+He mixture, in a magnetic field with an induction of 18 kilogauss. This method was found to have a high sensitivity and is capable of use with magnetic fields stronger than 1 kilo-oersted, a field intensity at which other methods are ineffective.

"The Effect of Dibazol on Interferon Formation by Cells of Fetal Sheep Skin After Infection of These Cells With the Virus of Contagious Ecthyma -- (Sheep Pox)"

Frunze, Izvestiya Akademii Nauk Kirgizskoy SSR, No 1, Jan/Feb 72, p 52

Abstract: It has been established in earlier work (Novikova, Veterinariya, No 10, 48-9, 1971) that the presence of dibazol increases the resistance of cells of fetal sheep skin to the virus of contagious ecthyma (sheep pox). A culture of fetal sheep skin was infected with the virus of contagious ecthyma in the presence and absence of dibazol. After the virus had been destroyed by the action of HCl for four days at 4°C, followed by addition of NaOH to pH 7.2-7.4, the interferon was titrated in a culture of fetal sheep kidney cells infected with the virus of contagious ecthyma. The culture medium from the skin cells infected in the absence of dibazol inhibited the cytopathic effect of the virus in a dilution of 1:2, while the medium from the skin cells infected in the presence of dibazol had this effect in a dilution of 1:8. This indicated that dibazol stimulated interferon formation by skin 1/2

"Reaction of Some Organometallic Monohydrides With Ethynylferrocene"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 6, Jun 72,
pp 1372-1375

Abstract: Continuing their studies in the field of bimetallic derivatives of the ethylene series $R_{n-1}M^mCH=CHM^mR_{m-1}$ which contain various combinations of elements (Sn, Ge, Sb, As, Si, Hg) in the molecule, the authors studied the addition of triphenylstannane, triphenylgermane and diphenylstibine to ethynyl-ferrocene and obtained respectively: (1-ferrocenyl-2-triphenylstannyl)ethylene (I), (1-ferrocenyl-2-triphenylgermyl)ethylene and (1-ferrocenyl-2-diphenylstibyl)ethylene. I reacts with corrosive sublimate to form α -ferrocenylvinylmercuric chloride, symmetrization of which with KI gives di-(α -ferrocenylvinyl)mercury, which under the action of corrosive sublimate is readily converted again to α -ferrocenylvinylmercuric chloride. Under the action of bromine I is converted into β -bromovinylferrocene. α -Chlorovinylferrocene reacts with lithiumtriphenyl-stannane to give (1-ferrocenyl-1-triphenylstannyl)-ethylene.

E. B. Tyuryukanova, G. A. Kuznetsova, N. Ya. Novikova,
S. B. Pozhivilova, G. A. Bogdanovich

The paper presents investigation data on the order of passage of abovementioned isotopes from the soil into food products with due regard for the soil nature and the accumulation of isotopes in the human body. The finding was that the extent of the passage of cesium-137 from the soil into food products fluctuated considerably and depended on the type of soil. Thus, in a soil consisting mainly of a sand fraction the passage of cesium-137 was more pronounced. Similar observation were made in respect to all of the objects examined. However, no differences in the migration of strontium-90 could be detected. Due to the high passage of cesium-137 into food products its content in the human body was high as well.

V sb. Khim. sredstva zashchity rast. (Chemical Agents for Plant Protection -- collection of works), vyp 1, Moscow 1970, pp 145-150 (from RZh-Khimiya, No 11, Jun 72, Abstract No 11N426)

Translation: Seed disinfectant dusts -- hexylmercury (1% EtHgCl, 18-22% hexachlorobenzene, and up to 20% γ -hexachlorocyclohexane) and phenylmercury (1% EtHgCl and 18-22% hexachlorobenzene) -- are officially authorized in the Soviet Union for use against the same plant diseases as those controlled by granosan. About half the EtHgCl expended when granosan is used is expended when phenylmercury and hexylmercury are used. Phenylmercury can be used against fusarium wilt and helminthosporiosis. The new disinfectants show promise as agents for controlling dwarf wheat infections and wheat kernel smut. The most promising signal dyes for the disinfected grain are Rhodamine C, methylene blue, acid blue-black and direct red 2G.

"Using Various Types of Amines to Extract Uranium, Zirconium, and Nitroso-nitrates of Trivalent Ruthenium From Nitrate Solutions"

Leningrad, Radiokhimiya, Vol 14, No 3, 1972, pp 473-476

Abstract: A study was made of the effect which amine structure has on the capacity of amine compounds to extract small concentrations of hexavalent uranium and trace concentrations of ^{95}Zr and ^{106}Ru (in the form of a mixture of nitrosonitrates of trivalent ruthenium) from nitrate solutions. The experimental data for uranium extraction confirm the results found previously by Schmidt and Mezhov ((Uspekhi khimii, Vol 34, No 8, 1965, p 1388). The results for zirconium and ruthenium showed no definite correlation between the structure of the amines and their capacity for extraction of these elements.

EFFECT OF PROLONGED HYPOKINETICS ON SEROTONIN METABOLISM IN RATS

Article by Z. S. Dilevko, S. P. Novikova and V. S. Shashkov, Moscow, E. S. Michaelov, Biology i Meditsina, No. 1, 1970, p. 60-75.
Submitted 19 May 1970

Abstract: A study was made of the effect of prolonged hypokinesia on serotonin (5-HT) metabolism in rats. It was found that motor activity restriction causes substantial normally in the 5-HT content in the duodenal blood and tissues, and also in the excretion of 5-HT metabolites. 5-Hydroxyindoleacetic acid (5-HIAA) in the urine, were observed on the first, third and thirteenth fifteen days of hypokinesia. Prolonged (more than 60 days) hypokinesia leads to a considerable increase in the blood 5-HT content; on the 30th and 40th days after "emergency" from hypokinesia the blood 5-HT content remains high.

Serotonin (5-hydroxytryptamine, 5-HT) is present in the tissues of virtually all species of animals. The literature contains information on participation of 5-HT in regulating motor, cardiovascular, digestive and other functions and body systems. It is regarded as a substance closely associated with the body endocrinological function, as an antidiuretic hormone, a blood pressure regulator, hemostatic, anaphylactic and antidiabetic agent, a growth factor, nervous system modulator, etc.

According to data in the literature from recent years, 5-HT, depending on body functional state, can intensify the effect of both the sympathetic and parasympathetic nervous systems. This made it possible to determine 5-HT as a modulator of the nervous system trophotropic function unrelated to any one part of it (Brode).

An examination of animals returning from brief spaceflight revealed definite shifts in the 5-HT blood content (V. S. Shashkov, et al.). It is

EFFECT OF IONIZED AIR ON ACETYLCHOLINE CONTENT AND CHOLINESTERASE ACTIVITY IN MICE OF DIFFERENT LINES

(from material)

[Article by R.-M. Anikster and S. P. Novikova; Moscow, Kosmicheskaya Biologiya i Meditsina, Russian, Vol. 2, No. 1, 1971, pp. 19-21, submitted for publication 30 April 1970.]

Abstract: Mice of different lines which were exposed to ionized air for 24 hours exhibited a reduced acetylcholine content in the intestine and an increased cholinesterase activity in the blood serum. Positive ions caused more distinct changes. Analysis of data in the literature and original findings by the authors suggest that one of the peculiarities of the physiological effect of atmospheric ions is their influence on the interaction between cholinergic and serotoninergic systems.

Under spaceflight conditions the air in spaceship cabins will be ionized under the influence of radiation. The predicted concentration of serotonin during irradiation in doses corresponding to the mean level of galactic radiation is 10^{-5} micrograms per 1 cu.³ (G. F. Aleksandryuk, et al.). Prolonged stays in a pressurized chamber have demonstrated a substantial influence on the human body by ionized air in the case of the concentrations of serotonin expected under real spaceflight conditions (Yu. G. Reftorov, et al.). However, the mechanism of the effect of ionized air has not been clarified.

The studies of G. K. Trofimov and O. V. Yesyrev, Krueger, et al., have demonstrated the participation of acetylcholine and serotonin in the mechanism of the effect of aerosols on the body. For example, G. K. Trofimov and O. V. Yesyrev conclude that the mechanism of the effect of aerosols on the ciliated epithelium of the mucous membrane of the esophagus is related to the activation of cholinesterase, causing a decrease in the concentration of acetylcholine in the epithelial cells.

We conducted experiments for studying the effect of ionized air on the acetylcholine-choline-cholinesterase system in mice.

METHOD FOR DETERMINING SEROTONIN (5-HYDROXYTRYPTAMINE) IN THE INTACT BLOOD OF RATS

(Space Physiology) 50-752

Article by Z. S. Bolgov, S. D. Novikova, and V. S. Shashkov; Moscow, Kosmicheskaya Biokhimiya i Meditsina, No. 4, pp 65-71, 1971, submitted for publication 23 April 1970]

In a study of the effect exerted on the body by extremal factors it is of considerable interest to determine serotonin (5-HT) in the blood of experimental animals.

The experiments made by some authors revealed that weightlessness, vibration, noise and spaceflight itself exert an effect on the 5-HT content in blood and tissues. Due to the need for further investigations in this direction we formulated the problem of developing methods for determining 5-HT in a small quantity of blood suitable for standard analyses of a large number of samples.

Existing methods for determining 5-HT in small volumes of blood have a number of shortcomings. The most sensitive method is the biological method, but the accuracy in determining 5-HT is dependent on the sensitivity of the biological test and condition of the animal from which the organ is taken as a test object. In addition, this method is extremely time consuming and unproductive.

The several biochemical methods for determining blood 5-HT require quite large quantities of blood (6-9 ml).

Waalkes, et al. proposed a specific method for determining blood 5-HT by modifying the Yudenefriend method. The use of this method requires 3 ml of blood; this was unacceptable under our conditions. Snyder, et al., described a method for determining 5-HT in the tissues of animals using nihydrin; this made possible an eightfold increase in method sensitivity.

We used the method developed by Snyder, et al. for determining blood 5-HT, precipitating proteins by the method devised by Waalkes, et al.; during the first stage of 5-HT extraction butanol was used instead of the usual acidic method. The latter was first proposed for extraction by Antell, et al. (1968).

"Interaction of Modified Polypropylene with Blood"

Moscow, Plasticheskiye Massy, No 4, 1972, pp 60-61

Abstract: The results of studying polymers with antithrombogenic properties are described. Data are presented on obtaining a sulfonated inoculated copolymer of polypropylene and polystyrene, and a study is made of the conditions permitting the polymer to be obtained which prevents the coagulation of blood on contact. With an increase in the active group content, the given copolymers cause significant hemolysis of the blood corpuscles. Iron ions must be introduced into the copolymer to eliminate this phenomenon. The presence of iron ions in the sulfonated inoculated copolymer polypropylene+polystyrene+polyvinylferrocene promotes a noticeable reduction in the hemolysis of the red blood corpuscles on contact of the blood with copolymers without changing the antithrombogenic properties.

"Allergy to Staphylococci in Patients With Burns"

Moscow, Klinicheskaya Meditsina, Vol 49, No 3, Mar 71, pp 87-92

Abstract: The persistent presence of Staphylococci in burn wounds, particularly in cases of severe burns, combined with absence of a stable immunity to infection with these microorganisms, led to the assumption that in patients with thermal burns an allergic state develops which plays an important role in the pathogenesis of Staphylococcus infections. Skin tests with Staphylococcus toxoid were carried out on 255 patients with burn traumas, in which the toxoid was applied intracutaneously. A positive skin reaction to the toxoid in a minimum dilution of 1:100, to which healthy persons do not react, was regarded as a sign of heightened sensitivity. The tests disclosed that the patients had initially a lowered skin sensitivity to the toxoid, which lasted for a period that increased in length with increasing severity of the burns. In patients with severe burn exhaustion and in cases of ultimately fatal burns

pp 87-92.

no skin reactions were observed during the entire period of observation (up to 1 yr). On termination of the period of lowered sensitivity, which must be regarded as due to inadequate immunological response, a heightened sensitivity was exhibited, due to allergic reorganization of the organism with respect to Staphylococci. Patients who had had severe burns and who returned 2-5 yrs later for treatment of scars or trophic ulcers exhibited a very high sensitivity to Staphylococcus toxoid. The sensitivity was more pronounced in patients with trophic ulcers than in those with scars. Sensitization to Staphylococci in persons with burns must be regarded as a factor that contributes to the prolonged course of Staphylococcus infections in burn patients and to the recurrence of these infections.

SOME PECULIARITIES OF COMMUNICATION PROCESSES IN
SMALL GROUPS

Article by T. V. Novikova. Moscow. Akademiya Nauk SSSR. Institute of Psychology. Current Problems in Space
Biology and Medicine, Russian, 1971, pp 207-207

A study was made of the influence of phonation on communication processes in 12 pairs of healthy subjects performing interdependent activity which consisted of a number of homeostatic problems of increasing complexity. During the course of their activity the subjects were afforded the opportunity of using a conversation device (tubular communication).

All the problems presented can be classified into three types on the basis of complexity. The first type includes the simplest problems (interdependence coefficient less than 1.0 in absolute value), not requiring separation of the functional tasks in the group. The second type includes complex problems (interdependence coefficient from 1.2 to 6.0), for successful solution requiring separation of the tactics of the subjects by type of leader. The third type includes conflicting (irresolvable) problems.

An analysis of the number of oral reactions of the subjects revealed that in solving problems of the first type a minimum number of oral communications is used. In the process of solving problems of the second type this number increases in the background experiment by a factor of five with the administration of phonation by a factor of six, and in solving conflicting problems, in the background experiment by a factor of 24 and with the administration of phonation by a factor of 18.

In groups with a clear separation of functional tasks the leaders use the conversation device six times less than

"Simulation of the Gathering and Processing Procedure in a Specialized System of Information"

Moscow, Nauchno-Tekhnicheskaya Informatsiya, Seriya 1. Organizatsiya i Metodika Informatsionnoy Raboty, April. 1972, pp 15-20

ABSTRACT: The paper discusses the problems of optimum distribution of the "upward" data flows in a specialized system of information in the field of geology on the basis of a simulation of the data gathering and processing procedures.

Quantitative characteristics of the geological information flows are highlighted, taking into account the specific features of this information. Logical restrictions are introduced to reduce the number of alternative, efficient patterns of organization of data connections at the stage of data gathering and processing.

Leningrad, Fiziologicheskiy Zhurnal SSSR imeni I. M. Sechenov, Vol 59, No 8, Aug 73, pp 1,176-1,182

Abstract: An increase in the permeability of the blood-brain barrier to methionine was demonstrated by autoradiography in new-born and 2-year-old rats, either 15 minutes or 24 hours after administration of 35 S methionine. In addition a decrease in the intensity of cerebral protein synthesis was observed in the intensity of cerebral protein synthesis was observed in 2-year-old animals, compared to 6-month-old mature ones. In comparing macroautoradiography, which presented an overall picture of layers and structure, and micro-autoradiography, which showed fine structure, the authors found that both gave identical results.

"Spatial Movement of a Pack of Two Bodies in Orbit"

Moscow, Izvestiya Akademii Nauk SSSR, Mekhanika Tverdogo Tela, No 5, 1971, pp
23-28

Abstract: A study was made of the movement of two particles connected by a flexible weightless thread and artificial Earth satellites put into orbit. The orbit of the center of mass of the system is assumed circular. The movement of such a pack of bodies in the orbital plane has been analyzed previously [V. V. Beletskiy, et al., Kosmicheskiye issledovaniya, Vol 7, No 3, 1969; Kosmicheskiye issledovaniya, Vol 7, No 6, 1969]. Here, some results are presented from studying the spatial movement of the bodies. In the general case of spatial movement, the regions of possible movement with a given energy reserve are isolated. The stability of the positions of equilibrium is investigated. In the case of bound movement (that is, movement of a pack of bodies with a tight thread) the regions are found in the phase space inside which the bound nature of the movement is preserved. There are phase trajectories lying wholly in these regions, that is, under defined conditions bound movement can continue indefinitely.

"Characteristics of Certain Protective Coatings Used in Point Resistance
Welding"

Moscow, Svarochnoye Proizvodstvo, No 10, Oct 70, pp 43-45

Abstract: A study was made of the effect of impact strength, film elasticity, covering power, and electrical conductivity of corrosion-resistant coatings based on various lacquers on joint quality during welding of type-09G2 steel. Fifteen percent aluminum powder was added to two of the lacquers in order to increase electrical conductivity. With coatings based on lacquers 170 and LSP-1 welding can be done for six days after application. The quality of welded joints covered with composition 119 is decreased if welding is performed more than two days after application of the coating. Oil-base paints are compatible with coatings based on composition 119 and 170 lacquer, but do not dry in the established time when painted over LSP-1 lacquer. Coatings based on 170 lacquer have the
1/2

USSR

PORNOY, N. D., et al, Svarochnoye Proizvodstvo, No 10, Oct 70, pp 43-45

greatest impact strength. The impact strength of coatings based on LSP-1 lacquer decreases as the temperature increases to 70°C. Such properties of coatings as elasticity, covering power, hardness, heat resistance, and drying time fall within the established norms set by the standards. When parts are painted with LSP-1 varnish and composition 119, the content of xylene in the working area somewhat exceeds the safety norm. When 170 varnish is used, the content of harmful substances falls within the safety norms. The best technological and mechanical properties are provided by corrosion-resistant, low-toxicity coatings based on 170 varnish.

"Isomerization of Alkenyl Esters of Phosphinous Acid and β -Ketophosphines"

Moscow, Doklady Akademii Nauk SSSR, Vol 203, No 3, 1972, pp 596-599

Abstract: This study follows earlier work by the authors on OC-metallized (Hg, Sn) carbonyl compounds, in which they devised methods for synthesizing substituted vinyl esters of phosphinous acid and also the isomeric β -ketophosphines. The present study concerns a new regrouping of the alkenyl esters of diphenylphosphinous acid into β -ketalkyldiphenylphosphines. The isomeric compounds isopropenyl (I) and α -ethylvinyl (II) esters of diphenylphosphinous acid, along with their isomers diphenylacetylphosphine (III) and 2-oxobutyl-diphenylphosphine (IV) were investigated. Neither heating nor distillation of these effected any mutual transformations. However, the alpha-substituted vinyl esters of phosphinous acid, in the presence of various nucleophilic stannocorganic compounds, and also the salts of certain metals, were converted into isomeric β -ketophosphines. Reaction times ranged from 3 hours to 30 days for the eight esters tested. Data obtained are summarized in tabular form.

"Reaction of Trialkylgermyl Dialkyl Phosphites With Unsaturated Compounds"
Leningrad, Zhurnal Obshchey Khimii, Sep 71, Vol 41, No 9, pp 2110-2111

Abstract: Trialkylgermyl dialkyl phosphites, as well as trialkylsilyl dialkyl phosphites, react with unsaturated compounds to form O- and C-organogermanium derivatives of phosphonates. Trialkylgermyl dialkyl phosphites have been synthesized from sodium dialkyl phosphites and triallylgermylchlorides in ether in 40-50% yield. Germyl phosphites readily react with sulfur, air oxygen and phenylazide. Trialkylgermyl phosphites treated with α,β -unsaturated compounds, ketones and carboxylates yield a mixture of O- and C-germanium-substituted phosphonates. Trialkylgermyl phosphites readily combine with acrylonitrile (30 mins., 80-100°C) with a good yield of an addition product over the C-C multiple bond -- diethyl β -trialkylgenyl- β -cyanoethylphosphonate. The yield is 70%. The reaction of trialkylgermyl diethyl phosphites with an equimolar amount of ketene yields a mixture of O- and C-germanium-substituted acetylphosphates.

"Reaction of Diphenylphosphine and Potassium Diphenylphosphide With
 α -Mercurylated Aldehydes and Ketones"

Leningrad, Zhurnal Obshchey Khimii, Vol 41 (103), No 4, Apr 71, pp 831-838

Abstract: Reaction of diphenylphosphine with mercuribisacetaldehyde and the reaction of potassium diphenylphosphide with chloromercuryacetaldehyde in a solution of dimethoxyethane takes place with a transfer of the reactive center yielding vinyl ester of diphenylphosphinous acid. In contrast, α -mercurylated ketones react with these reagents in two ways, yielding α,β -substituted vinyl esters of the diphenylphosphinous acid (O-phosphorylation) and α -phosphorylated ketones (C-phosphorylation). The course of the reaction depends on the electron density at the phosphorus atom, on the structure of organomercury compound and on the type of solvent used. The reaction course involving the transfer of the reactive center with the formation of O-isomers is favored by higher electron density on the phosphorus atom, higher basicity, and coordination ability of the solvent. The opposite factors favor the reaction without a transfer of the reactive center to the 1,2-position, leading to the formation of C-isomers.

"Reaction of Trialkylsilyldialkylphosphites With Unsaturated
Compounds"

Leningrad, Zhurnal Obshchey Khimii, Vol 40, No 9, Sep 70, p 2129

Abstract: Trialkylsilyldialkylphosphites add easily to saturated and unsaturated carbonyl compounds. In the case of α, β -unsaturated aldehydes, ketones and carboxylic esters, a formation of one of the isomers or of a mixture of O- and C-siliconorganic derivatives of phosphonic acids is possible. For example, trimethylsilyldiethylphosphite (I) reacted with ethylacrylate or acrolein gives a mixture of O- and C-derivatives of trimethylsilylether. Mesityl oxide₂₀ gives only the C-derivative, b.p. 109-110°/1 mm, d_{4}^{20} 0.9908, n_D^{20} 1.4470. With ketene the reaction occurs smoothly, yielding $(EtO)_2P(=O)-C(:CH_2)OSiMe_3$, b.p. 109-110/10 mm, d_{4}^{20} 1.0111, n_D^{20} 1.4355. Benzaldehyde reacted with (I) yields $C_6H_5CH(OSiMe_3)-P(=O)(OR)_2$, b.p. 124-125/1-1.5 mm, d_{4}^{20} 1.0465, n_D^{20} 1.4825.

"Spectral Investigation of the Electron-Donor Capacity of Triethyl Phosphite as a
Method of Evaluating the Purity of Phosphites"

Moscow, Izvestiya Akademii Nauk SSSR: Seriya Khimicheskaya, No 3, Mar 70, pp 689-690

Abstract: When ethanol forms a hydrogen bond with triethylphosphite, the absorption band for the H-complex (3560 cm^{-1}) has a secondary peak at about 3480 cm^{-1} . It was found that the asymmetry of the absorption band is due to a slight admixture of triethylphosphate. The amount of impurity was determined by studying the ternary triethylphosphite-triethyl-phosphate-ethanol system. The spectral method used for quantitative determination can detect a phosphate impurity of the order of 0.005 M/l in the H-complex. A study of the electron-donor capacity of triethylphosphite and its carbon analog orthoformic ether as compared with H-acids showed that the integral intensity of the band of the H-complex of ethanol with triethylphosphite is less than with orthoformic ether. The frequency shifts as compared with ν_{OH} of free ethanol are 82 and 87 cm^{-1} respectively. A similar pattern is observed when a stronger proton donor -- trifluoroethanol -- is used. The reasons for the reduction in the proton acceptor properties of triethylphosphite as compared with its carbon analog are now being investigated.

from chromatographically pure primary n-octyl and n-decyl mercaptans, were compared with the properties of Alvisone-K, obtained from mercaptan concentrate extracted from polysulfide petroleum of the Ishimbay type, as well as Alvisone 8-10 obtained from a mixture of synthetic alcohols C₈-C₁₀ (supplied by YU. B. KAGAN and S. M. LOKTEV). Alvisone-K was found to be only slightly inferior to Alvisones 8 and 8-10 in herbicidal activity. Data were obtained on the dosage of "Alvisone" herbicides under field conditions, based on three-year field plot tests conducted at the Pushkin base of the All-Union Institute of Plant Protection (Leningradskaya Oblast), as well as by the Chair of Agriculture of the Soil Biology Faculty of Moscow University (Moskovskaya Oblast).

The results indicate that Alvisone-K possesses a number of properties (e. g., low toxicity for warm-blooded animals, stability under storage) which make it promising for the control of annual di-

cotyledonous weeds in carrot plantings. Alvisone can be used as a contact herbicide as a supplement to soil preparations (of the propazine type etc.). The most convenient way of preparing these α , β -unsaturated sulfones is three-stage synthesis from mercaptans, either individual ones or mixtures thereof.

The authors thank T. YE. PIVOVAROVA, V. I. DRONOV, V. KH. SYUNDYUKOVA, T. S. PAPKO for taking part in the synthetic portion of the work, P. V. SABUROVA for taking part in the hothouse tests, A. V. ZAKORDONETS and YE. V. ARZAMASTSEV for determining the toxicity for warm-blooded animals, and Professor R. D. OBOLENTSEV and V. S. BURYY for their interest in the study.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A SMALL OIL FLOW (0.5 M PRIME3
-DAY) WAS OBTAINED FROM THE 2993-3300 M INTERVAL FROM A HOLE DRILLED IN
THE TITLE AREA. THE OIL WAS OF LOW RESIN AND LOW S. PARAFFIN TYPE WITH
VERY SMALL CONTENT OF ASPHALTENES AND N. ITS LOW COOKING ABILITY
INDICATED THE PREDOMINANCE OF PARAFFIN HYDROCARBONS. THE PETROLEUM
CONTAINED ALSO LITTLE OF ACID PRODUCTS AND A SMALL AMT. OF MECH.
IMPURITIES. THE GASOLINE FRACTION WAS CHARACTERIZED BY HIGH SATN.
CONTENT OF PARAFFIN HYDROCARBONS WAS ON THE AV. 70PERCENT. AN INCREASE
IN CONTENT OF AROMATIC HYDROCARBONS, REACHING MAX. (15.5PERCENT) IN THE
175-200DEGREES FRACTION, WAS OBSO. DURING INCREASE IN TEMP. OF BOILING.
INCREASE IN CONTENT OF S WAS OBSO. SIMULTANEOUSLY WITH INCREASE IN AMT.
OF AROMATIC HYDROCARBONS. THIS SUBSTANTIATED THE FACT THAT GASOLINES OF
METAMORPHOSED OILS, RICH IN CH SUB4 HYDROCARBONS, CONTAIN LARGE AMT. OF
AROMATIC COMPODS. THE 60-95 AND 150-75DEGREES FRACTIONS HAD THE MAX.
CONTENTS OF NAPHTHENE HYDROCARBONS. FACILITY: INST. GEOL. NAUK,
MINSK, USSR.
